extreme weather patterns**

□ The work of building up healthy, living soils by farmers is crucial for having soils that can hold water during drought spells so plants survive. Here healthy maize fenced by a newly planted vetiver fence.

Garden farm at One World University, Mozambique

▫ **A model garden farm at a Farmers' Club in Guinea Bissau with simple systems to protect against the sun.**

▫ Numerous farmers have started to grow trees around and in the fields. These trees store carbon, help to fertilize the soil, and help to reduce wind erosion, the drying out of the soil and temperature extremes. Here mango trees and a fence of jatrophas in Guinea Bissau.

It is important to inform young and old about the importance of preserving and reestablishing mangroves to protect against coastal erosion and other damages from rising and stormier seas, and for the nature in general – here at DNS Ramiro in Angola.
